

# The DemoLand project

Urban Analytics *in the wild*

Dani Arribas-Bel

# Background

# Context

- Newcastle City Council
- Local Spatial Plan
- Policy needs, challenges

# Goals

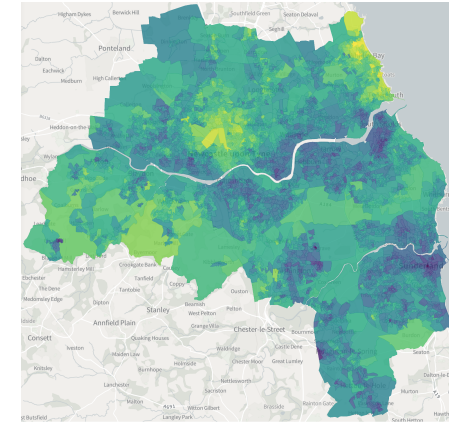

- Quantify competing aspects of land use in a given urban environment through key indicators (*baseline*)
- Build bespoke scenarios under changes that affect the distribution of such land use (*scenarios*)
- Present outputs in an interactive visualisation tool

# Baseline

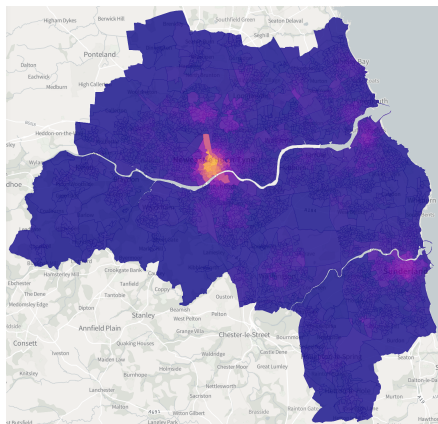

# Indicators

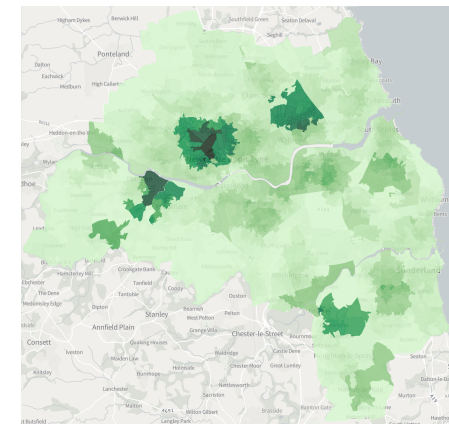

Air Quality

House Prices

Job Accessibility

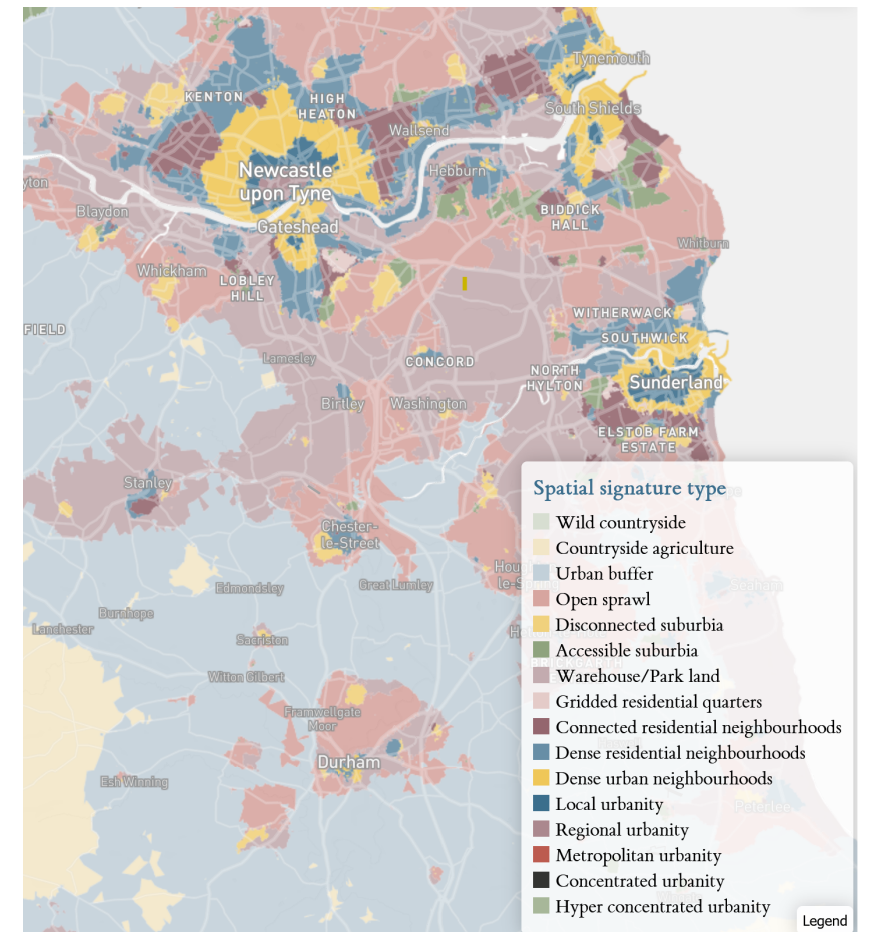

Green Space Accessibility

# Land Use - Spatial Signatures

*Characterisation of space based on form and function designed to understand urban environments*

[UrbanGrammarAI.xyz](http://UrbanGrammarAI.xyz)

# Land Use $\leftrightarrow$ Indicators

## Accessibility scores

- Employment
- Green space

## Predictive models

- Air quality
- House prices

# *What if* scenarios

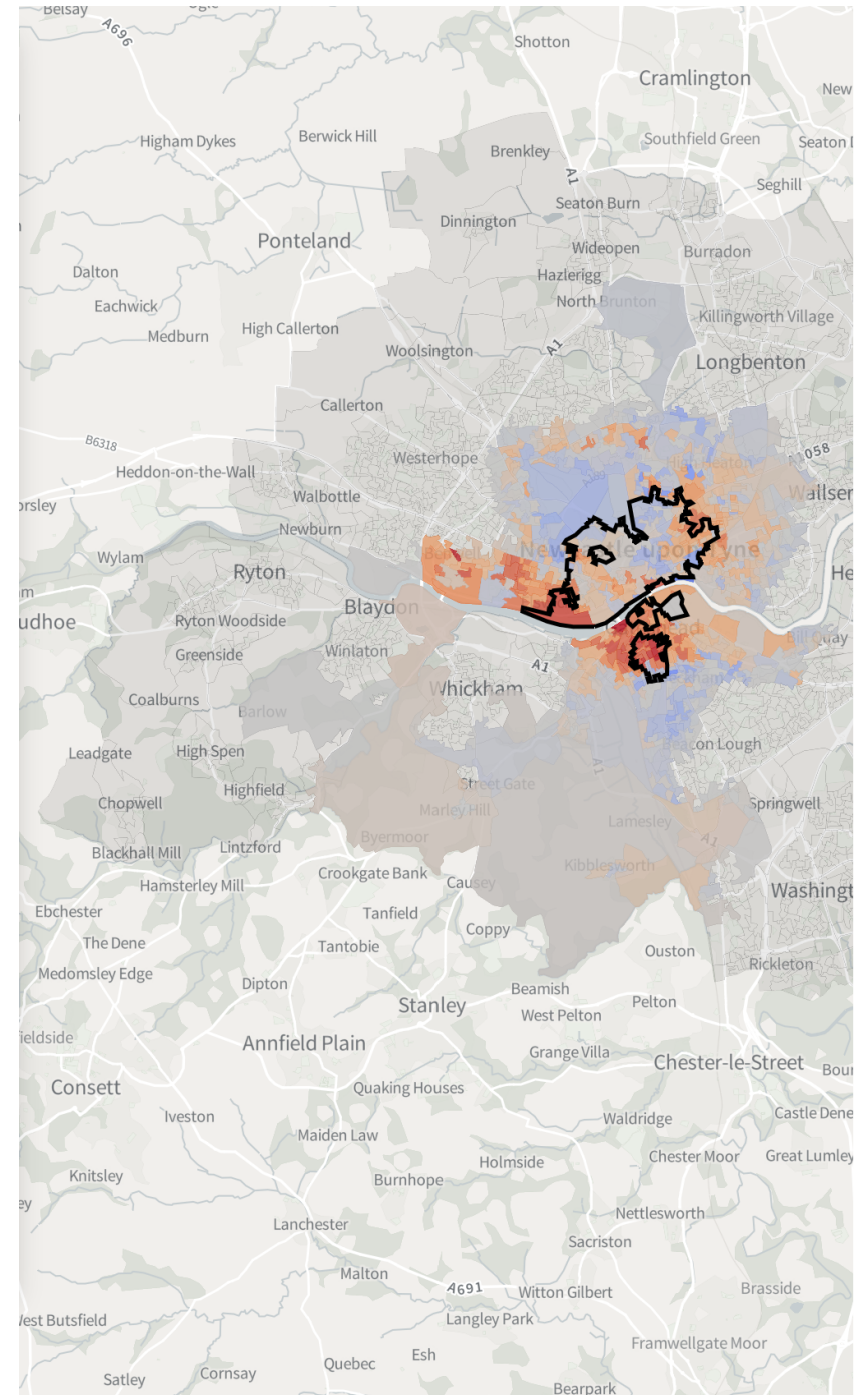

Exploring the effect of **changing**  
the baseline **land use** on the  
indicators of interest

## Baseline

The world as it is

## Scenarios

The world as it *could* be

# Co-produced scenarios

- Residential development
  - Low density (1)
  - Mid-density compact (2)
- Inner-city densification (3)
- Brownfield redevelopment (4, 5)
  - Dense neighborhoods (4)
  - Parks (5)
- Combinations (6, 7)

# Interactive tool

**Demo [URL]**

# Play time - Activity I

- [10min] Explore the set scenarios on your own
- [10min] Think of a new scenario you would like to explore
  - Why is it relevant?
  - What changes would it contain?
  - What effects would you expect?

# Play time - Activity II

New version! [\[URL\]](#)

- [\[15min\]](#) Implement your scenario (use the **spatial signature descriptions** for help)
- [\[10min\]](#) Explore the changes when compared to the baseline
  - Are they in line with your expectations?
  - What is unexpected?
  - Why do you think this is?

# “Behind the scenes...”

Urban Data Science and all that jazz...

- Policy relevance
- Data, data, data
- Models, spatial analysis, machine learning
- Co-production
